A BENCHMARK ON THE AERODYNAMICS OF A RECTANGULAR 5:1 CYLINDER

REQUESTS FOR COMPUTATIONAL SIMULATIONS

1. INTRODUCTION

In the following sections, the data are described which are necessary to allow comparisons to be carried out of the results obtained by all the researchers involved in the benchmark.

The data are subdivided in *required* and *encouraged*: while the former are mandatory for all the researchers participating in the benchmark, in order to assure that a minimum amount of information is always available, the latter are strongly recommended to allow the comparison of as many as possible data. Of course, every researcher is free to include any *additional* data that are considered significant from a scientific point of view.

2. PHYSICAL MODEL:

- a. Reynolds Number (with respect to dimension D) (required)
- b. Mach number (if incompressible M=0) (required);
- c. state law (if compressible) (encouraged);
- d. approach to turbulence: unsteady RANS, LES, DES, DNS, ... (required);
- e. closure turbulence model (required);
- f. wall treatment (wall functions, damping functions, ...) (required).

3. MODEL GEOMETRY

- a. shape of the boundary of the computational domain in the xy plane (rectangular, circular, ...) (required);
- b. dimensions \mathcal{D}_{x} , \mathcal{D}_{y} , \mathcal{D}_{z} of the computational domain in all directions ($\mathcal{D}_{z} = 0, 2D$ domain) (required);
- c. maximum distance Λ_x in the x-direction of the input boundary from the leading edge (required);
- d. radius of curvature of the model cross section edges (R=0, sharp edges) (required).

(see Figure 1 for notations)

Figure 1 - Model geometry

4. SPACE GRID

- a. grid topology, e.g. Cartesian, fully structured, fully unstructured, unstructured in the *xy* plane and structured along the *z* axis, hybrid (structured in the grid boundary layer at wall and unstructured elsewhere), number and types of blocks (required);
- b. number of nodes (required);
- c. number of cells (required);
- d. maximum, minimum and averaged normal distance *nw* from the wall of the first node layer closest to the wall (nondimensionalized with *D*, required);
- e. number of layers and growing ratio in the grid boundary layer at wall, if any (required);
- f. average number of nodes along the cross-section contour of the cylinder (required);
- g. average number of nodes in the streamwise plane xy (encouraged for 3D computational domains only);
- h. average number of cells in the streamwise plane xy (encouraged for 3D computational domains only);
- i. maximum, minimum and average grid element size Δ_z in the spanwise direction z (required for 3D computational domains only);
- j. distribution of the cell volume Vc and skewness Sk along the straight lines y/D=0 and x/D=3.5 at z/D=0 (encouraged, ASCII file with three-column format: x or y, Vc, Sk).

(see Figure 2 for notation)

Figure 2 - Space grid conventions (*nw* depends on variables collocation)

5. TIME GRID

- a. grid topology (fixed or adaptative time-step) (required);
- b. time step size (required);
- c. number of time steps (encouraged).

6. INITIAL CONDITIONS

- a. type of initial conditions (homogeneous in space, restart from a previous simulation, ...) (required);
- b. initial values for all flow variables (if homogeneous, included the additional ones used for turbulence modelling, if any) (required).

7. **BOUNDARY CONDITIONS**

a. boundary conditions used for all flow variables (included the additional ones used for turbulence modelling, if any) on all boundaries (required).

8. NUMERICAL APPROACH - SPACE DISCRETIZATION

- a. space discretization method (FEM, FVM, FDM, ...) (required);
- b. variable collocation (co-located, staggered,...)(required);
- c. order of accuracy in space (required);
- d. description of the numerical dissipation (none, proportional to grid size, tunable...) (required);
- e. other information characterizing spatial discretization (type of variable interpolation, quadrature rules, shape functions,...) (encouraged).

9. NUMERICAL APPROACH - TIME ADVANCING

- a. time advancing scheme (explicit, implicit, fractional...)(required);
- b. order of accuracy in time (required).

10. NUMERICAL APPROACH – SOLVER

a. other information characterizing the used solver (coupled or segregated, pressure-velocity coupling method, method used for solution of linear or nonlinear systems, under relaxation, ...)(encouraged)

11. CONVERGENCE

- a. residual threshold for each variable at each time step (if an iterative solver is used) (required);
- b. mean number of iterations per time step (if an iterative solver is used) (encouraged);
- c. under relaxations factors (if an iterative solver is used) (encouraged);
- d. acceleration techniques (local time-stepping, multigrid, residual smoothing, ...) (if any, encouraged)

12. COMPUTATION

- a. computer system:
 - i. processor type (encouraged);
 - ii. number of processors employed (encouraged);
 - iii. RAM (encouraged);
 - iv. number of FLOPS (FLoating point Operations Per Second) (encouraged);
- b. total CPU time (encouraged).

13. Results for preliminary check

- a. maximum, minimum and averaged normal distance from the wall of the first node layer closest to the wall in terms of wall units y+ (required);
- b. check the mean value of the Cp = 1 at the stagnation point p0 (required, see Figure 3).
- c. check the steadiness of the flow statistics (e.g. mean value, standard deviation and frequency content of drag and lift coefficients) converge for increasing sampling periods, excluded the initial transient. Indicate the interval in which the (steady) statistics are computed, in terms of nondimensional time units $t^*=tU/D$ and in terms of vortex-shedding cycles (required).

14. RESULTS FOR COMPARISONS

The results format is given for 3D computational domains and 3D results. Vectors *z*-component should be set equal to zero otherwise (e.g. 2D domains, spanwise averaged results). See Figure 3 and Table 1 for notations.

- a. <u>Integral parameters:</u>
 - i. mean value and standard deviation of the aerodynamic force per unit length coefficients $(C_F = F/(0.5\rho U_{\infty}^2 D))$, C_x , C_y and Cm_z (torque is meant evaluated with respect to the origin of the reference system) (required);
 - ii. Power Spectral Density of the aerodynamic force per unit length coefficients $C_x(t^*)$, $C_y(t^*)$ and $Cm_z(t^*)$ as a function of the nondimensional frequency fD/U (required, ASCII file with four-column format: fD/U, PSD(C_x), PSD(C_y) and PSD(Cm_z));
 - iii. time histories of the aerodynamic force per unit length coefficients $C_x(t^*)$, $C_y(t^*)$ and $Cm_z(t^*)$ (encouraged, ASCII file with four columns format: t^* (nondimensional), C_x , C_y , Cm_z);
 - iv. length of the mean recirculation bubble along the side surface of the body in the central section (z=0), evaluated based on the friction coefficient (required);
 - v. length of the mean recirculation bubble along the side surface, averaged in time and also in the spanwise direction (z) if periodic boundary conditions are used (encouraged).
- b. Local parameters statistics:
 - i. statistics of pressure coefficient (*Cp*) for all the nodes in the central section of the body (*z*=0) (required, ASCII file with five-column format: $s/D, \overline{Cp}, Cp_{std}, Cp_{skew}, Cp_{kurt}$, where *s* is the curvilinear abscissa defined in Figure 3);
 - ii. statistics of pressure coefficient (Cp) averaged in the spanwise (z) direction if periodic boundary conditions are used (encouraged, ASCII file with five-column format: $s/D, \overline{Cp}, Cp_{std}, Cp_{skew}, Cp_{kurt}$);
 - iii. mean value and standard deviation of the friction coefficient (*Cf*) for all the nodes on the central section of the body (*z*=0) (encouraged, ASCII file with three-column format: $s/D, \overline{Cf}, Cf_{std}$);
 - iv. mean value and standard deviation of the friction coefficient (*Cf*) averaged in the spanwise (*z*) direction if periodic boundary conditions are used (encouraged, ASCII file with three-column format: $s/D, \overline{Cf}, Cf_{std}$);
 - v. mean values of the x-velocity (required) and standard deviations (encouraged) of the x and y-velocity along the straight line l1 (y=0, z=0) (ASCII file with four-column format: $x/D, \overline{u_x}, u_{x std}, u_{y std}$, with $u_{x std}, u_{y std} = 0$ if not provided);
 - vi. mean values and standard deviations of the x-velocity and y-velocity along the straight lines $l_{2}^{(x/D=2.5, z=0)}$, $l_{3}^{(x/D=3.5, z=0)}$, $l_{4}^{(x/D=4.5, z=0)}$ (encouraged, ASCII files with five-column format: $y/D, \overline{u_x}, u_{x,std}, \overline{u_y}, u_{y,std}$).
- c. <u>Local parameters time histories and coherence functions:</u>
 - i. time histories of the velocity components at points mA and mB (encouraged, ASCII files with fourcolumn format: t^* (nondimensional), u_x , u_y , u_z);
 - ii. time histories of the pressure coefficient at points p1 p18 (encouraged, ASCII files with twocolumn format: t^* (nondimensional), Cp).
 - iii. Coherence functions of surface pressure at positions (*x/D*=-1.5, *y/D*=0.5), (*x/D*=1.5, *y/D*=0.5) and (*x/D*=2.5, *y/D*=0) for $\Delta z_1 = 1/12B$, $\Delta z_2 = 3/12B$, $\Delta z_3 = 5/12B$, $\Delta z_4 = 7/12B$, $\Delta z_5 = 9/12B$ (encouraged, ASCII files with six-column format: *fD/U*, coh(Δz_1), coh(Δz_2), coh(Δz_3), coh(Δz_4), coh(Δz_5)).
- d. Flow fields:
 - i. mean value and standard deviation distributions on the central section of the domain (z=0) or averaged in the spanwise direction if periodic boundary conditions are used (encouraged):
 - 1. velocity (ASCII file with eight columns format: x/D, y/D, u_x , u_{xstd} , u_y , u_{ystd} , u_z , u_{zstd});
 - 2. *Cp* (ASCII file with four columns format: x/D, y/D, \overline{Cp} , Cp_{std});

- 3. vorticity (ASCII file with eight columns format: $x/D, y/D, \overline{\omega_x}, \omega_{xstd}, \overline{\omega_y}, \omega_{ystd}, \overline{\omega_z}, \omega_{zstd}$)
- ii. instantaneous distributions, 20 samples during the period corresponding to the main frequency observed in the lift spectrum (encouraged):
 - 1. velocity (ASCII files with six columns format: x/D, y/D, z/D, u_x , u_y , u_z);
 - 2. *Cp* (ASCII files with four columns format: *x/D*, *y/D*, *z/D*, *Cp*);
 - 3. vorticity (ASCII files with six columns format: x/D, y/D, z/D, ω_x , ω_y , ω_z).

15. SENSITIVITY STUDIES

Sensitivity studies are strongly encouraged.

Recommendations about the sensitivity studies to the incoming flow characteristics (angle of attack, Reynolds number, turbulence intensity and length scale) are shared with the experimental approach (see par. *Requirements for further sensitivity studies on the incoming flow* in the *Overview of the Benchmark*).

Recommendations are given in what follows about computational and modelling features:

- a. residual convergence by performing the simulation with two or more successively lower residual thresholds, common to every variable at each time step, are strongly recommended (if an iterative solver is used);
- b. space and time grid convergence by performing the simulation on two or more successively finer grids are strongly recommended;
- c. parametrical studies on closure turbulence models (including subgrid models) and wall treatment in the frame of the same approach to turbulence are encouraged.

16. ADDITIONAL REFERENCES

References cited by the author(s) of the study and not enclosed in the benchmark general database should be listed (required, if any).

17. CONTACT INFORMATION

Affiliation, complete address and e-mail of the author(s) of the study should be enclosed.

18. UPLOAD DATA FILE

The complete set of the set-up data and the required and recommended results should be provided in the tabular-type file, according to the proposed format for download. The ASCII files with space distributions and time histories should be provided in separated, zipped file. The whole data set should be provided in a single archive.
